

# Spanish article selector

Write a Python program called `article.py` that will choose the correct article for word given as a single positional argument. Although there are exceptions, Spanish tends to use "el" for words ending in "o" and "la" otherwise. The entire output will be in the form:

```
Me gusto {article} {word}.
```

For example, if the input is "chico", the article should be "el":

```
$ ./article.py chico
Me gusto el chico.
```

And "la" for "chica":

```
$ ./article.py chica
Me gusto la chica.
```

It should print a brief usage if provided with no arguments:

```
$ ./article.py
usage: article.py [-h] str
article.py: error: the following arguments are required: str
```

And a longer usage for the `-h` or `--help` flags:

```
$ ./article.py -h
usage: article.py [-h] str

Choose the correct Spanish article

positional arguments:
  str                Input text

optional arguments:
  -h, --help        show this help message and exit
```

It should pass all the tests:

```
$ make test
pytest -xv test.py
